Melodyne studio 3.1.2.0 2560361 .WordPress Vulnerability: An Introduction to the PoC This post intends to introduce you to a certain vulnerability in WordPress. We talk a lot about web security in this blog, about various vulnerabilities and also about the best practices and tools for securing WordPress. The vulnerability we are going to talk about today was recently disclosed to WordPress. It can be found on their official website. Here is what you can do in order to protect yourself and your website from the recently disclosed flaw. Let's get started! "WordPress has an old known secret. This is a serious vulnerability and can be used to hack the admin section of any website. Fortunately, it requires privilege escalation to be active, but still, it can be really nasty." Let me tell you a bit about this vulnerability, how it works, what can it be used for and where it impacts the most. WordPress Vulnerability: How It Works This vulnerability is a memory corruption bug. Sometimes it can be used to execute a script that will then lead to a privilege escalation. In other words, you could end up doing something worse than someone else on your website. Basically, what it means is that if you're an admin of a WordPress website, and you will exploit this vulnerability, the attacker will be able to take over your whole website. The attacker can also use this flaw to send spam, deface your website, delete important files or even take over your website without your knowledge. This vulnerability can be exploited by authenticated users, but only if the user has a specific role, meaning that they have admin privileges. What can you do to Protect yourself from the vulnerable WordPress? There are several things you can do: Update the WordPress Make sure to update WordPress to the latest version as quickly as possible. This will help you in resolving this problem and prevent further exploitation. Add the following to the robots.txt file User-agent: \* Disallow: /wp-admin/ Restrict the Apache Web
