i have to fix this for my PC. If anyone is having trouble with the sound on their PC, try pressing the Audigy button twice on your keyboard and your sound should turn off. this did not work for me. from my experience and from reading forums, the PCSX2 is only compatible with the HARDWARE that was released in late 2008 and after. ***pcsx is compatible with gamecube and nintendo ds games, so the compatibility should be compatible to hardware and software. another great thing is that after installing pcsx it automatically starts up when the PC is restarted. Another version of the PCSX2 is out. It is the 0.9.8e-

rc4, and you can download it from here. There are a lot of changes to the core code in this version, but there are also a lot of new things. Here are the changes: - Added support for GCN-based games (in addition to GCN and Nintendo 64) - Added ScummVM to the list of supported backends - Removed the support for ARM9 CPUs in PCSX2 - Faster sound - Better command line help - Support for new experimental driver API -... Note that in a few hours this will become the official version. However, if you want to help me to test this new version, you can also download it here: On the PCSX2 forum, I posted a guide for using the new driver. It is my personal opinion, but this guide is good. However, if you want to use the PCSX2 with a game that can only be played with the old driver, you can not use this guide. I hope that this will get the PCSX2 even better on Linux. That's also how you should edit the config.lilypad file. You can delete it and generate a new one from the official PCSX2 0.9.8e-rc4 thread. Download the official 0.9.8e-rc4 thread. You can download it here: It is the latest version of PCSX2. You can also download the official PCSX 82157476af
